Signature	<i>Raymond D. Rood, DVM</i>

*NSA = no significant abnormalities

These radiographs were taken as a survey of the most common sites for a lesion. They are not, nor are they meant to be a complete examination of the joints taken. They will identify approximately 90% of the common lesions. To identify the remaining infrequent lesions or to provide complete coverage of all joints would require many more views. These survey views usually represent the best combination of coverage and economics.
